

Track High-Value Medical Stock, Error-Free With a Single Device

Mobile device scanning eliminates the need for dedicated devices

Lost revenue and time due to error-prone consignment inventory management are serious issues for manufacturers of high-value medical devices. But there is an effective remedy.

Scandit's mobile barcode scanning software ensures error-free stock taking and clinical consumption reporting to protect your revenue and reduce the cost of inventory.

Sales teams and hospital staff can capture individual or multiple UDI labels in a single scan, accurately recording the content of a medical shelf or a patient sheet. Unlike expensive and maintenance-heavy Bluetooth or RFID scanners, Scandit-powered mobile devices are a reliable, efficient and cost-effective way to know exactly where your medical products are and when they are used.

See Scandit technology in action

Point-of-Storage

Scan and stock take individual medical products efficiently.

Scan and stock take multiple medical products in one go.

Point-of-Use

Accurately record medical device consumption before surgery.

Digitalize patient sheets post-surgery to save time and replenish stock correctly.

With smartphone scanning you can:

- Read GS1 or HIBC labels and capture data matrix or linear barcodes in seconds.
- Automatically parse and decode label data to access key information such as GTIN, LOT and expiration dates.
- Read information on non-barcoded items with Optical Character Recognition.
- Reliably scan in any hospital or storage condition including low light, glare or when products are tightly packed.
- Speed up inventory management with MatrixScan to capture all product codes and multiple products on a shelf at once.
- Visualize critical information with an Augmented Reality (AR) overlay.
- Reduce your total cost of ownership (TCO) and management time of Bluetooth scanners and RFID technology, while experiencing the same speed and convenience.
- Easily integrate and deploy Scandit technology with any system.

Why Mobile Scanning is a Smart Way to Manage Medical Device Inventories

Reliably Accurate

Scan and parse UDI labels with any barcode symbology, plus scan serialized non-barcoded products.

Time Efficient

Read an entire medical sheet or shelf with multiple products in a single scan.

Cost-Effective

Smartphone-scanning is more accurate and advanced than a Bluetooth scanner and is a fraction of the cost of an RFID scanner.

We'd love the opportunity to discuss how Scandit could make your work easier and your customers happier.
